UNIVERSITY

**Center for Translational
Social Neuroscience**

CTSN Sponsored Course Offering Fall 2011

IBS 703R

Current Topics in Behavioral Neuroscience

The purpose of the course is to provide in-depth experience in the evaluation of current or emerging cutting edge science. The faculty will rely heavily on current research papers and emphasis will be placed on how and why certain lines of experimental investigation developed.

In the Fall of 2011, the course will focus on topics relevant to translational social neuroscience. Each week, students will be responsible for presentation and discussion of a journal article relevant to the research topic being presented by faculty in the second class of the week. Topics of discussion will include animal models, the biology of cooperation, compassion, and social reciprocity, neural systems involved in social behavior and social cognition, and psychiatric disorders characterized by disruptions in the social domain.

Credits: 3

Meets: Twice per week

Time and Day: To be determined

Place: To be determined

Permission of course instructor required
